

Product Options Manager 1.0 Documentation

Installation & Configuration

Do you sell products with product options like sizes, liters or m2? Are you tracking the stock? Well, then you have probably noticed that by default all product options are displayed on the productpage. Even the out of stock product options. To see the stock availability of all product options you would have to select each individual product option. This takes time and it will eventually damage the customer experience which will lead to a decrease in conversion rate.

Functionality: Customize how to display the product options on the product-page:

- Hide out of stock product options
- Add stock label in dropdown menu: 'in stock' or 'out of stock'
- Add stock quantities in the dropdown menu

**IMPORTANT: Please be aware that you should not hide out of stock product options if you:*

- *Don't track your stock*
- *Allow purchases even when out of stock*

Stock management:

- Don't track
- Track, deny purchases when out of stock
- Track, allow purchases even when out of stock

1. Hide out of stock product options

As soon as you install the Product Options Manager, the out of stock product options will not be displayed on the productpage. This works by default and it doesn't require any modification. Now, the option 'Show non stock products marked in grey' is not selected.

2. Show not in stock products marked in grey & Stocklabels

If you want to display the out of stock product options, but greyed out, then please select the option "Show non stock products marked in grey".

Below in the settings you can edit the label, for example 'in stock' and 'not in stock' or 'in stock soon'.

3. Display stock quantity

You can also display the stock quantity directly in the dropdown menu. Just select the option 'Show quantity for products in stock'.
